Approved Tools Policy

MolecularMatch utilizes a suite of approved software tools for internal use by workforce members. These software tools are either self-hosted, with security managed by us, or they are hosted by a Subcontractor with appropriate business associate agreements in place to preserve data integrity. Use of other tools requires approval from leadership, and modification of this policy to reflect that approval.

List of Approved Tools

- **Github**. Github offers a secure environment for hosting code that passes our internal security metrics. It is used to store and version control application code, scripts, and infrastructure automation tools. It provides a mechanism to version control.

- **Dropbox**. Dropbox is used for storage of files and sharing of files with Partners and Customers.

- **Google Apps**. Google Apps is used for email and document collaboration.
